

Dear Lovable team,

This document is intended to give you a clear and practical overview of what the Kinship Brain is, how we envision it working, and what we are looking to build together inside the Lovable platform.

Our goal with this brief is to share context early so your development and product teams can assess feasibility, required resources, and the best way to approach this build. We want this to be a collaborative process where we align on scope, responsibilities, timelines, and what each team needs from the other before moving into detailed execution.

The Kinship Brain is a real operational system for Kinship, not a demo or a prototype. At the same time, it is designed to become a strong reference implementation for Lovable. This brief should help frame that opportunity and set us up for a productive working conversation.

Why it matters for Kinship

As Kinship grows across funds, SPVs, and partnerships, information and relationships are increasingly fragmented across tools, documents, and people. This creates operational friction, duplicated work, and risk.

The Kinship Brain is designed to:

- Act as a single source of truth for relationships, context, and documentation.
- Support daily decision-making for founders and operators.
- Reduce operational overhead while enabling scale.
- Serve as a repeatable system that can later be extended to select partners or founders within the Kinship ecosystem.

Why it matters for Lovable

For Lovable, the Kinship Brain represents a real, high-context build inside the Lovable platform:

- A flagship example of how non-technical operators can build a powerful operating system using Lovable.
- A system used daily, not a demo or prototype.
- A documented build process that can later be translated into case studies, PR, and enterprise storytelling.
- A foundation for additional case studies across other operator-led and brand-led businesses.

What the Kinship Brain Should Do

At a functional level, the Kinship Brain should support the following core capabilities:

- Act as a centralized relationship and knowledge hub for LPs, founders, partners, companies, and initiatives.
- Allow the team to prepare for meetings, generate summaries, surface context, and suggest follow-ups based on past interactions and stored knowledge.
- Connect structured data (records, projects, pipelines) with unstructured data (notes, emails, decks).
- Support daily workflows such as relationship tracking, decision prep, internal memos, and content or PR-related initiatives.
- Be configurable and usable by non-technical operators, without relying on engineering support for everyday changes.

The system is not intended to replace every existing tool, but rather to connect and orchestrate them into a coherent operating brain. **A detailed system structure is included as an appendix for full context and reference.**

Core Systems & Data Sources to Connect

The Kinship Brain is expected to connect to a set of core systems and data sources, including (but not limited to):

- Email (Gmail/Front) – conversations, follow-ups, relationship history.
- Meetings & notes – summaries, decisions, action items.
- Documents & decks – data rooms, memos, presentations.
- CRM / relationship records – LPs, founders, partners, companies.
- Internal communication tools (e.g. Slack) – context and signals where relevant.
- Project / initiative tracking – SPVs, campaigns, partnerships, content initiatives.

The exact depth and direction of these integrations should be aligned jointly based on feasibility and priorities.

What We Need From the Lovable Team

To evaluate and execute this build, we are looking to align with Lovable on:

- A dedicated technical point of contact or small team responsible for development and implementation.
- Product and technical guidance on:

- Data structuring and configuration inside Lovable.
- Feasibility tradeoffs and recommended patterns.
- Collaboration during build phases to:
 - Translate Kinship workflows into concrete Lovable configurations.
 - Adjust UX, language, and interaction patterns to fit a high-touch, brand-forward context.
- Training and knowledge transfer so the Kinship team can operate, maintain, and evolve the Brain over time.

At Kinship, we have a clear understanding of what we need and how it should work, and we're looking for the right team to partner with us to bring it to life.

Phased Approach & Working Timeline

Working timeline (pending confirmation):

The Kinship Brain is expected to be built using a phased, iterative approach, with details to be confirmed jointly with the Lovable team based on capacity and resourcing.

Proposed phases (high-level):

1. **Discovery & Design:** Understand real Kinship workflows, decisions, and data sources; define functionalities and what needs-to be done.
2. **Build & Configuration;** Set up the workspace, data connections, core flows, and initial prompts.
3. **Onboarding & Validation:** Kinship leadership uses the system in real scenarios; feedback and refinement.
4. **Documentation & Case Study Preparation:** Capture the process and outcomes for future reuse.

Working timeline assumptions (to be confirmed):

- Build kickoff: **January 2026**
- Beta version: **April–May 2026**
- Case study documentation finalized: **May 2026**

Final phases, sprint structure, and dates will be aligned after Lovable reviews feasibility and team availability.

Partnership & Responsibilities

- **Kinship**
 - Owns the vision, workflows, and real-world usage of the Kinship Brain.
 - Leads scoping, prioritization, and project coordination.
 - Provides access to data, operational context, and ongoing feedback.
 - Leads documentation and narrative development.
- **Lovable**
 - Acts as the development and implementation partner.
 - Builds the Kinship Brain within the Lovable platform.
 - Advises on feasibility, architecture, and best practices.
 - Supports training and long-term operability.

How to read this collaboration

The roles above reflect how the teams will work together in practice: Kinship leads vision, scope, and day-to-day direction, while Lovable leads development and technical execution. Certain areas require close collaboration and mutual alignment to ensure feasibility, quality, and successful delivery.

A simplified RACI is included below to clarify ownership, decision-making, and collaboration points:

Area	Kinship	Lovable
Product Vision & Scope Definition	Responsible/Approves	Consulted / Approves
Project Management & Prioritization	Responsible	Consulted / Aligns
System Development & Implementation	Consulted	Responsible
Technical Feasibility & Architecture	Consulted	Responsible/ Approves
Training & Knowledge Transfer	Informed	Responsible
Documentation & Case Study Production	Responsible	Consulted/ Contributes
Network Activation for Case Studies	Responsible/approves	Consulted / Approves
External Narrative & Public Use	Responsible/Approves	Consulted/Approves

Open Questions / To Align Together

To be aligned during next steps:

- Depth and sequencing of system integrations.
- Team composition and level of dedication from Lovable.
- Sprint structure, review cadence, and feedback loops.
- Access models for future partner/founder use (to be defined later).
- Priority apps and tools to connect and which integrations can be made into the system.

This brief is intended to create shared understanding and alignment before moving into detailed scoping and execution. The Kinship Brain is a real operational build with long-term implications for both teams, and early clarity on feasibility, responsibilities, and collaboration is critical to its success.

APPENDIX A

Kinship Brain — Full System Structure

This section will serve as the detailed reference for what is being built and will be reviewed jointly during scoping.

This section defines the full product scope desired for the Kinship Brain. The detailed functional outline, system modules, and phased development plan are defined by Kinship and incorporated here as the authoritative reference for what is being built.

MUST HAVE

1. Workspaces & Shared Teams

What the user should be able to do

- Create a workspace for their team or join an existing one.
- All data—records, pods, pipelines, projects, dashboards—lives inside a workspace.
- Team members inside the same workspace can:
 - View shared records,
 - Work off shared pods,
 - Collaborate on pipelines and projects,
 - See shared dashboards.
- Users should be able to use the contact data from their team workspace and pull it into their own views with their own pods, projects, etc., while respecting permissions.
- Support a **Kinship “home” workspace** plus additional **team and partner workspaces**, so Kinship can:
 - See and manage its own universe of relationships.
 - Optionally allow trusted partners to operate their own workspaces that still interoperate with Kinship Brain.

External sharing & ecosystem

- Users should be able to:
 - Share **curated lists** with people outside the system (e.g., “NYC best restaurants,” vendor lists, perks lists).
 - Create **list templates** (e.g., “LP relationship template,” “Vendor perks template”) that can be used by internal or external users.
- External users may:
 - Use the tool / lists,

- Contribute enrichment (e.g., add their own vendors, notes, links, updated recommendations),
 - Without necessarily having full access to Kinship's private data.
- Over time, this should support a **community-style data contribution model**: in certain cases, people get value from the system by also enriching Kinship's ecosystem (similar to a community or membership model rather than pure SaaS), while honoring privacy rules.

What's built

- Create/join workspace
- Multi-tenant data model
- Shared team access
- Workspace-level settings
- Permission scaffolding (core, not full RBAC yet)

Additional Notes

- We want to share curated lists with people outside our system (example: NYC best restaurants) while controlling what they can see or edit.
- Need the ability to create list templates or share discounts with internal users (e.g., promo codes, partner perks).
- People will get to use our system, but they will contribute to enrichment of our ecosystem where appropriate.
- Need clear patterns for:
 - Normal workspaces (Kinship universe + team workspaces).
 - **Rare "private universes"** for special cases where Kinship chooses not to see all underlying data (e.g., a select GP or alpha influencer).
- How do we ensure the protection of sensitive information?
 - This ties into the Permissions & Access Control section (see Feature 10).

2. Relationship Records (People + Companies)

What the user should experience

- The CRM uses a single unified object called a **Relationship Record**.
- When creating a new record, the user chooses:
 - **Contact** (a person), OR
 - **Company** (an organization).
- Contact records include:
 - Name, email, phone, role/title, company/affiliation.
- Company records include:

- Name, industry, stage, listed status, ticker, domain.
- Every record must show, in one place:
 - All **Pods** it belongs to (e.g., Maps, Maps Light, LPs, Talent, Service Providers, General, etc.).
 - A **timeline of interactions and updates** (emails, meetings, notes, projects, pipelines, news alerts).
 - Linked **pipelines / investments** (relationship opportunities, fundraising pipelines, etc.).
 - Linked **projects** (One Table, SPVs, campaigns, events, etc.).
 - Linked **companies** (for contacts) and linked **people** (for companies).
 - Important dates and custom fields.

Record layout & widgets

- Records should follow a layout similar to best-in-class CRMs:
 - Central **timeline** of interactions (chronological).
 - Side or top **widgets** that surface:
 - Data highlights,
 - Recent activity,
 - Relationship health,
 - Key pod-based context (e.g., LP thesis, Maps history).
- The design should support evolving toward:
 - A more **visual relationship timeline** (e.g., graph or timeline view),
 - A **relationship “feed” widget** pulling in news, social updates, and system alerts for that person/company.

Associations & organization

- Each Relationship Record acts as the **canonical hub** for:
 - Associated companies, projects, pipelines, investments, meetings, emails, and tasks.
- Associations must be:
 - Many-to-many (one person in multiple projects, one project with many people).
 - Easy to navigate from the record view.

Fields & pods

- Fields are:
 - **Type-specific** (Contact vs Company) AND
 - **Pod-aware** (certain fields appear only when relevant pods are present).
- Fields should be:
 - Grouped by **pod** (e.g., LP fields grouped together).

- **Conditional:** fields only show if they're suggested or relevant for that record type + pod(s).

Records List & Bulk Actions (within Relationship Records)

- Users should have a **Records List view** that allows them to:
 - Filter by:
 - Pod and subpod,
 - Relationship type (Contact vs Company),
 - Activity recency (e.g., untouched > 90 days),
 - Investment status,
 - Sector, geography, etc.
 - Select multiple records and perform bulk actions:
 - Bulk add to **projects**,
 - Bulk add to **pipelines**,
 - Bulk update certain fields (where safe),
 - Bulk export lists.

What's built

- Record creation (Contact + Company types)
- Type-specific fields
- Record detail view
- Record timeline foundation
- Notes & basic interactions
- Basic Records List with filtering and bulk actions (foundation for advanced segmentation)

3. Customizable Pods

What the user should be able to do

- Create unlimited pods to organize their relationship universe however they want:
 - e.g., "LPs," "Podcast Guests," "Maps," "AI Founders," "Philanthropy Partners," "Advisors," etc.
- Customize each pod with:
 - Name
 - Color
 - Description
- Add subpods under any pod (e.g., Maps → Music / Tech / Fashion).
- Assign a record to multiple pods and mark one as the primary.
- Use pods to drive:

- Required fields,
- Follow-up cadence / sequencing,
- Inclusion in external lists (e.g., Substack VIP vs General).

Kinship's initial pod structure (+ subpods)

- For the Kinship implementation, we expect pods such as:
 - **Maps** (by category)
 - **Maps Lite**
 - **LPs** (LP Internal, LP PR, SPV)
 - **Talent** (Traditional, Influencer)
 - **Service Providers** (by industry)
- Maps and Maps Light are **capacity-limited**:
 - e.g., Maps may be limited to ~150 people to force curation.
 - The system should support rules/workflows for “managing people up or out” of these pods.

Required questions per pod

- Each pod should allow the user to add required questions that must be filled out during categorization.
- For example:
 - LP pod → “Commitment Amount,” “Fund Name”
 - Maps – Tech → “How did you meet?,” “Role in the tech ecosystem”
- A record cannot be added to a pod until these required questions are answered.
- Answers to pod questions:
 - Live on the Relationship Record,
 - Are visible in pod-specific sections,
 - Are used later by AI (matching LPs to opportunities, suggesting intros, etc.).

What's built

- Create + customize pods
- Subpods
- Optional primary pod
- Pod-specific required questions (critical foundation for categorization)
- Pod-based field groupings on the record

4. Incoming Contact Categorization Workflow

What the user should experience

All unsorted contacts appear in a **Pending Categorization** tray before entering the CRM.

Pending records can come from:

- Manual entry
- Basic email parsing (name + email)
- CSV import
- Voice capture transcriptions
- Meeting note-taker summaries or email threads that contain new names

The **Categorization Modal** should allow the user to:

- Select one or more pods (MAPS, MAPS Lite, LPs with referral subpods, Talent with Traditional/Influencer subpods, Service Provider subpods).
- Complete **pod-specific required questions** before the record can be added.
- Add contextual notes (e.g., how we met, referral source, etiquette notes).
- Assign a primary pod if applicable.
- Save → moves the record into the CRM and removes it from Pending.

History

Every categorization action (who categorized it, what pods were chosen, what fields were completed) is saved to the record timeline.

What's built

- Pending Records tray
- Categorization modal
- Pod-specific required question enforcement
- Multi-pod assignment with primary pod option
- Categorization history in timeline
- Foundation for future auto-detection of missing contacts from email, meetings, and voice notes

5. Basic Dashboard (Initial Widgets)

What the user should see

A simple, modular dashboard that shows the essential operational signals for relationship management, including configurable widgets such as:

- Total records
- Pod totals (MAPS, MAPS Lite, LPs, Talent, Service Providers)
- Pending categorizations
- Recently updated records
- Quick links to pipelines, projects, and the nurturing/maintenance hub

Users should be able to:

- Show/hide widgets
- Reorder widgets
- Create multiple dashboard views (e.g., personal vs workspace default)

This dashboard establishes the foundation for future top-level modes such as:

- **Brain View** — day-to-day relationship work
- **Feed View** — RSS-style network news
- **Maintenance View** — review and nurturing tasks

What's built

- Modular dashboard
- Multiple views
- Export capability
- Widget visibility and ordering

6. Pipelines (Unlimited Relationship Opportunities)

What the user should experience

- Users can create as many pipelines as they want:
 - LP fundraising pipeline
 - Deal flow pipeline
 - Talent outreach pipeline
 - Partnership pipeline
 - Any other relationship-driven motion
- Each pipeline contains:
 - Customizable stages (name + color)
 - A Kanban board view
 - Cards representing **Relationship Opportunities** (non-sales “deals” tied to relationships)

Relationship Opportunities (cards that show in the pipeline, have their own information for tracking that pipeline deal, and connect to the relationship record)

- Every card must:
 - Be linked to one or more **relationship records**
 - Shown as:
 - **Name of the project or investment** in the pipeline view
 - Linked back to the **person/company** in the relationship record view.
 - Have its own:
 - Notes
 - Stage
 - Priority
 - Status

Sync to Record Timeline

- Whenever an opportunity changes:
 - Stage changes
 - Notes added
 - Status updates
 - Opportunity hidden/archived
- ...these events appear on the main relationship record timeline.
- Important: Ideally it will read emails for context and update statuses and add notes automatically and notify us when a follow up is needed

Relationship recommendations

- When a pipeline is created or updated, the system should:
 - Recommend people to add based on:
 - Investment thesis,
 - Pod metadata (e.g., LPs who invest in AI),
 - Past interactions.
 - Over time, use enrichment (news, sector focus, previous deals) to refine these suggestions.
- Later enhancements (mapped to AI Intelligence Layer) can:
 - Auto-suggest updates or follow-ups for opportunities.

Hiding Pipelines

- Users can hide pipelines they are no longer using without deleting them.
- Hidden pipelines still maintain their connection to all records.

What's built

- Create unlimited pipelines
- Drag-and-drop Kanban
- Relationship Opportunity cards
- Syncing updates to record timeline
- Hide-but-not-delete pipelines
- Pipeline snapshots for dashboard

7. Projects Module**What the user should experience**

- Create projects to organize any initiative that involves multiple records:
 - Podcast guest outreach
 - Philanthropy campaigns
 - A new product launch
 - A MAPS strategy project
 - Preparing a list of relationships for an event
 - SPV-specific initiatives (e.g., SPV investor outreach)
- Each project includes:
 - Project name, description, and owner
 - Associated records
 - Associated Relationship Opportunities
 - Notes and updates
- Projects become high-level containers that help users manage relational work that is **not strictly a pipeline**, but often connected to one.

Projects vs Pipelines

- Pipelines:
 - Focus on **stages** and **movement** toward an outcome.
- Projects:
 - Focus on **context**, **scope**, and **collection** of people/opportunities around a theme or initiative.
- Some projects may still be managed in external tools (e.g., ClickUp), but the CRM should:
 - Hold the **core relationship data**,
 - Keep projects at least linked and visible at the relationship level.

What's built

- Create projects

- Attach records to projects
- Attach opportunities to projects
- Simple project overview page
- Notes + updates

8. Relationship Nurturing & Maintenance Hub

What the user should be able to do

This is the “care and feeding” and “maintenance” area of the CRM—surfacing the most important moments and tasks in relationships.

Users should see:

- **Important dates & milestones**
 - Birthdays
 - Anniversaries
 - Date joined a fund
 - Key deal events
 - Company launch date
 - Custom dates the user wants tracked
- **Stale relationships**
 - “No interaction for 90 days”
 - “No update since last meeting”
- **Maintenance queue**
 - Contacts in capped pods (e.g., Maps) who may need to be:
 - “Managed up” into higher-priority pods,
 - Or “managed out” to Maps Light / General.
 - Contacts missing essential context or pod-required fields.
- **Basic suggestions**
 - “These people have milestones this week.”
 - “These records haven’t had any interaction lately.”
 - “These Maps Light contacts haven’t been reviewed.”

All nurturing and maintenance signals should be:

- Visible in one **Nurturing & Maintenance Hub** view, and
- Also surface across other modules:
 - Dashboard widgets
 - Record-level alerts
 - Pipeline or project views where relevant.

What's built

- Important dates surfacing (birthdays, anniversaries, milestones)
- Stale relationship detection
- Basic suggestions (non-AI)
- Nurture/maintenance feed + alerts
- Integration with dashboard & record pages

9. Data Enrichment (Baseline Version)

What the user should experience

The system automatically pulls relationship-relevant context from external and internal sources and saves it into each record timeline on an ongoing basis.

Baseline enrichment includes:

- **News & press signals**
 - Company raises, launches, press mentions
 - Founder activity headlines
- **Email metadata**
 - Last interaction date
 - Direction of communication
 - Subject preview
- **Meeting summaries from AI note-takers**
 - Synced to the timeline (upon user approval/set criteria)
 - Editable by users
 - Used to detect new contacts and context

Automatic Detection

From email, calendar, and meeting sources:

- Detect **new contacts** not yet in the CRM
- Prompt the user to categorize them
- Suggest relevant pods (future AI improvement)
- Auto-link enrichment to existing records by updating the timeline, notes, fields, etc.

Every enrichment update:

- Writes to the timeline
- Surfaces in nurturing/maintenance

- Influences AI recommendations

What's built

- News/Google enrichment
- Email metadata ingestion
- AI note-taker meeting summary import
- Timeline writing
- Basic new-contact detection + categorization prompts

10. User Permissions & Access Control

What the user should experience

Organizations should be able to set clear controls over who sees what.

Role types:

- **Admin**
 - Full control of workspace settings, pods, records, pipelines, projects.
- **Editor**
 - Can edit records, add notes, manage pipelines, create projects.
- **Viewer**
 - Can view data but cannot modify.

Additionally:

- Permissions for Pods (e.g., "Only the fundraising team can view LP pod")
- Permissions for Pipelines (e.g., "Only partners can view deal flow pipeline")
- Permissions for Projects (e.g., "Share this project only with the comms team")
- Permissions for specific **records** or subsets of records when needed (e.g., private relationships).
- Ability to share pods or pipelines selectively with individuals or sub-teams.
- Ability to define **special private-universe workspaces** where Kinship chooses not to see all underlying data (rare but important pattern).

This ensures Kinship Brain works for multi-team organizations with different access needs and aligns with the ecosystem/community sharing model.

What's built

- Admin / Editor / Viewer roles

- Permissions for:
 - Pods
 - Pipelines
 - Projects
 - Records
- Selective sharing of pods/pipelines with individuals or teams

11. Deep Integrations

What the user should experience

Kinship Brain must integrate with key tools used in high-touch relationship organizations.

Project Management Tools (ClickUp, Notion, Asana)

Users can:

- Push follow-up reminders into ClickUp tasks.
- Sync tasks inside a project to their PM tool.
- Automatically log key CRM activity into PM systems.
- Include PM tasks on project dashboards.

Social & Monitoring Tools (Perplexity, Google Alerts)

- Pull updates from:
 - Social platforms
 - Press monitoring tools
- Add relevant signals to record timelines.
- Trigger nurturing/maintenance suggestions (“Congratulate them on their launch!”).

Email / Shared Inbox Tools (Gmail, Outlook, Front)

- Initial phase:
 - Basic signals from tools like Front, Gmail, etc. (see Data Enrichment and Full Email + Calendar Integration in Nice-to-Have for deeper sync).
- Long-term:
 - Evaluate how much can be consolidated versus remaining in external tools.

Behavioral Pattern

- When something notable happens externally, the system should surface it as a relationship signal and suggest follow-up actions.

What's built

- ClickUp / Notion / Asana integrations:
 - Push follow-ups
 - Sync tasks inside project view
 - Show CRM data inside PM tools
- Social/monitoring integrations:
 - Company updates
 - Influencer or founder updates
 - Press mentions

12. Lovable Mini App Spin-Offs (On-Top “Micro Apps”)**What the user should be able to do**

Non-technical team members should be able to use **Lovable** to quickly build “mini apps” on top of Kinship Brain, without rebuilding the core CRM. These micro apps:

- Run off of **Kinship Brain data** (records, pods, pipelines, projects, enrichment).
- Support **specific workflows** (AP tracking, meeting approvals, quick campaigns, RSVP tracking, etc.).
- Write results **back into** Kinship Brain so everything stays in one relationship graph.

Example use case:

A team member needs a quick way to gather a list of records with certain parameters and put them into an email list where the system creates custom draft emails for each person, pulling personalized knowledge from Kinship Brain.

Concretely, a user should be able to:

- Start from a **filtered view** in Kinship Brain (e.g., “All LPs in Maps who invest in AI and haven’t been contacted in 90 days”).
- Click an action such as “**Send to Lovable App**” or “**Create mini app from this view**”.
- In Lovable, configure:
 - Which fields and pods to use as context (e.g., LP thesis, last interaction, notes).
 - The type of output (e.g., one email per person).
 - The campaign or list name (e.g., “Fundraising Check-In – Q1”).
- Generate **custom AI-drafted emails** for each selected relationship:
 - Each draft uses the person’s:
 - Pod metadata,
 - Past notes,

- Recent enrichment (news, milestones),
 - Pipeline/project context.
 - User can review, tweak, and approve or discard drafts individually or in bulk.
- Push final emails:
 - Back into the email tool (e.g., Front/Gmail) for sending, and
 - Back into Kinship Brain as timeline entries and updated “last interaction” data.

Platform requirements for spin-offs

- Lovable apps must be able to:
 - **Query** Kinship Brain (respecting permissions) for:
 - Records,
 - Pods & subpods,
 - Pipelines & opportunities,
 - Projects,
 - Timeline/enrichment snippets.
 - **Write back:**
 - Notes,
 - Status changes,
 - Tags/fields,
 - “Email sent” / “Action taken” events to the timeline.
- Apps should inherit:
 - Workspace-level **permissions** (only see what the user can see),
 - Pod and pipeline visibility rules.

More examples of mini app spin-offs

- Meeting approvals or routing tools (e.g., approvals for who gets a meeting, driven by pod & pipeline status).
- Quick outreach mini apps (like the email-list example above).
- Custom approval/reporting views that roll up from these apps into:
 - A **master approvals view** per user,
 - A **reporting view** per workspace.

What's built

- Core “Lovable app” integration layer, including:
 - Secure API / data access from Lovable into Kinship Brain (records, pods, pipelines, projects, enrichment).
 - Ability to send a **filtered record set or view** from Kinship Brain into a Lovable mini app.

- Ability for Lovable apps to **write back** actions and notes to Kinship Brain (timeline + key fields).
- At least one **reference mini app** in collaboration with Lovable for:
 - Building an email list from a filtered record set.
 - Generating **custom AI-written email drafts** per relationship using Brain context.
 - Saving those drafts and interactions back into the record timeline.

NICE TO HAVE FEATURES

1. Expanded Dashboard

What the user should see

- Add more widgets such as:
 - Pipeline snapshot (number of opportunities at each stage)
 - Nurturing alerts (upcoming birthdays, stale relationships)
 - Recently enriched records (news, meeting notes, email updates)
 - Quick links to:
 - Projects
 - Active pipelines
 - Prioritized records
- Users should continue to customize:
 - Which widgets appear
 - The order of widgets
 - Personal vs workspace default views

Over time, this should support distinct top-level dashboard modes:

- **Brain** – work surface for records, pods, pipelines, projects.
- **Feed** – RSS-style stream of network news and updates.
- **Maintenance** – prioritized queue of tasks, reviews, and up/out decisions.

What's built

- Pipeline snapshot widget
- Nurturing alerts widget
- Enrichment updates widget
- Customizable widget visibility/order

2. Projects Module (Full Version)

(Foundational version built in Month 2; this enhances it into a complete workflow engine.)

What the user should experience

- Projects should function as containers for any relationship-driven initiative, with the richness and flexibility of a lightweight project management tool.
- Users should be able to create projects like:
 - “Podcast Guest Outreach”
 - “Fundraising Round”
 - “Board Member Search”
 - “Maps Strategy 2025”
 - “Philanthropy Initiative”
- Link multiple types of data:
 - Records (people & companies)
 - Relationship Opportunities (pipeline cards)
 - Pods (e.g., a project could be tied to the “AI Founders” pod)
- View a project dashboard showing:
 - High-level progress
 - Total relationships associated
 - Opportunities linked to the project
 - Notes and updates
 - A timeline of project-specific activity

This should feel like a **relational project workspace** rather than a generic task-managing tool.

What's built

- Project dashboards
- Linked pods
- Relationship metrics per project
- Activity feed
- Project-level milestones and summaries

3. AI Intelligence Layer

What the user should experience

The system begins proactively thinking on their behalf, offering strategic relationship guidance.

AI should recommend:

- **Who to contact this week**, based on:
 - Stale relationship signals
 - Recent milestones (news, updates, emails)
 - Important dates approaching
- **Which LPs match a fund thesis**
 - AI reviews metadata + interaction history + pod details + enrichment.
- **Who should be included in a new project**, such as:
 - A campaign
 - An outreach list
 - An investment round
- **Which relationship opportunities to revisit**, based on:
 - Long inactivity
 - Recent market/news signals
 - Pattern detection

AI Contextual Reasoning Must Incorporate:

- Email metadata
- Meeting notes (AI summaries)
- Press/news mentioned in enrichment
- Pod-specific required questions/answers
- Past interactions and notes
- Pod capacities and “up vs out” rules where relevant.

AI should be visible across:

- Dashboard suggestions
- Nurturing & Maintenance Hub recommendations
- Project creation flow (“Suggested people to add”)
- Pipelines (“Suggested opportunities to revisit”)
- Record detail (“Suggested next action”)

What's built

- AI suggestions on:
 - Who to contact this week
 - Which LPs fit a thesis
 - Who belongs in a new project
 - Which opportunities to revisit
- AI reasoning that uses:
 - Emails

- Meeting notes
- News
- Pod metadata
- Past interactions
- AI surfaces integrated into:
 - Dashboard
 - Nurturing Hub
 - Projects
 - Pipelines
 - Record view

4. AI-Generated Meeting Briefs

What the user should experience

- Before every meeting, users should be able to click a button and receive a fully prepared Meeting Brief, automatically generated from existing context.

Each brief includes:

- Relationship history / last interactions
- Key notes previously logged
- Shared interests
- Mutual connections
- Pod memberships
- Social or business updates
- Recent news or company milestones
- Open Relationship Opportunities tied to this person

This should feel like having an assistant prepare a pre-meeting dossier in seconds.

What's built

- One-click prep kit
- Auto-pulled context from:
 - Timeline
 - Notes
 - News
 - Social updates
- Generated:
 - Talking points
 - Shared interests

- Mutual connections
- Recent milestones

5. Custom Reports

What the user should experience

Users should be able to build customizable reports on:

- Pod distribution
- Pipeline conversion %
- Fundraising velocity (LP pipelines)
- Engagement over time
- Top relationships by touchpoints
- Project-based analytics
- Invitation/outreach performance

Reports should support:

- On-screen visualization
- Export to CSV or PDF
- Ability to save favorite reports
- Workspace-wide vs. user-specific views

This allows managers, founders, and operators to make strategic decisions with visibility.

What's built

- Build-your-own reporting
- Report types:
 - Pod distribution
 - Pipeline conversions
 - Fundraising velocity
 - Project analytics
 - Engagement over time
- Export to CSV / PDF
- Saveable reports

6. Advanced Data Cleaning

What the user should experience

The system should help keep their database clean, reliable, and trustworthy.

Features include:

- **Duplicate detection & merging**
 - “These two records seem similar, would you like to merge them?”
- **Invalid field alerts**
 - Bounced email
 - Invalid phone structure
 - Missing pod-required fields
- **Automated stale contact reports**
 - “These 25 records haven’t had an interaction in 180 days.”
- **Missing required data flags**
 - Prominently shown inside the record
 - Quick actions to fill in missing info

Cleaning signals should appear:

- Inside Records
- Inside the Nurturing & Maintenance Hub
- As optional widgets on the dashboard

What’s built

- Duplicate detection & merging
- Invalid data warnings (bounced email, bad format)
- Automated stale contact alerts
- “Missing pod-required fields” indicators

7. AI-Driven Auto-Categorization

What the user should experience

- The system automatically suggests pods during categorization based on:
 - Email context
 - Meeting notes
 - News articles
 - Job titles and company info

- Social updates
- Connection patterns
- Users can accept, modify, or ignore suggestions.

This makes onboarding new records extremely fast and supports the community/ecosystem model (people contribute useful data with less friction).

8. Social Graph & Intros Engine

What the user should experience

- A visual relationship graph that shows:
 - How people and companies connect
 - Mutual connections
 - Potential intro paths
 - Influential hubs in your network
 - Clusters of related ecosystems (e.g., AI, fashion, venture capital)

Users could:

- Click a person → see all second-degree paths.
- Ask the system for “Best intro path to Jane Doe.”

This helps founders, investors, and operators understand their network at a glance and align with Kinship’s philosophy of referrals and trusted introductions.

9. Chrome Extension

What the user should experience

While browsing LinkedIn or a website, users can:

- See whether someone is already in the CRM.
- Add someone with one click.
- Assign pods immediately.
- Trigger categorization questions.
- View relationship history without opening the CRM.

This makes the CRM a companion to daily browsing, similar to Clay or Apollo but relationship-first.

10. Full Email + Calendar Integration

What the user should experience

- Real-time syncing of:
 - Emails
 - Calendar events
 - Attachments
 - Meeting invites
 - Email threads
- Automatically added to the record timeline as interactions.

Example:

- Meeting scheduled → appears on record with participants.
- New email → updates last interaction + timeline entry.

This gives the AI and Nurturing Hub much richer context.

11. Mobile App

What the user should experience

On the go, users can:

- Quick-add ideas
- Update records
- Trigger follow-ups
- Save meeting summaries
- View key dashboard widgets
- See immediate AI suggestions

Mobile ensures Kinship Brain becomes a daily companion rather than a desktop-only tool.
